

Air Pollution – Brief Analysis for March 2023

Below is a brief representation of data captured by portable devices installed in multiple locations in Korba, Delhi and Ranchi. The analysis has been done for two reporting periods – 1 March to 31 March 2023 and Jan 2022 to March 2023

Section 1 – Data Analysis for period Jan 2022 to March 2023

Monthly Average AQI Values - Different Cities

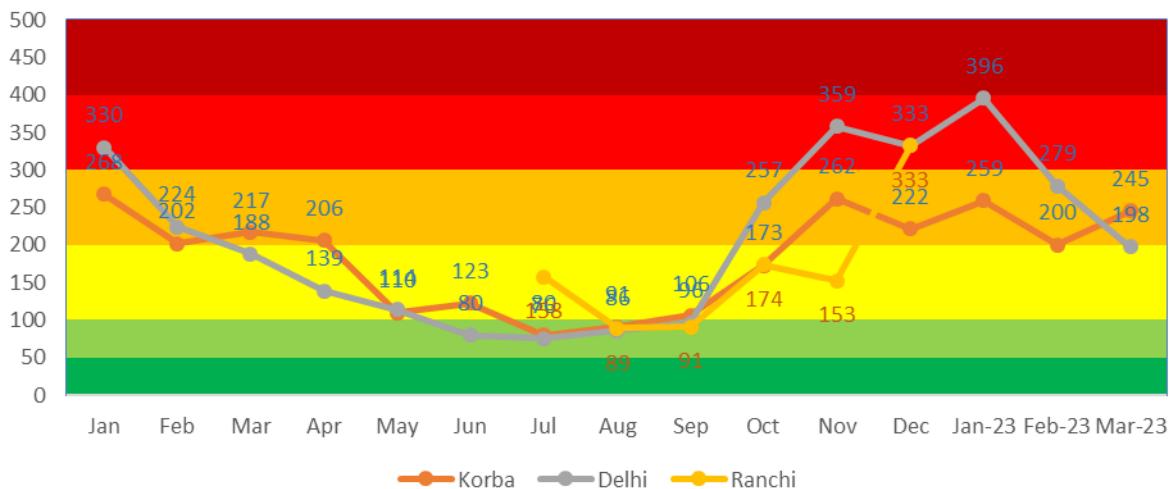

Table and Graph above show the Average Monthly AQI in different Cities. The graph and data clearly showcase the winter months when AQI comes under dangerous levels and summer and monsoon months when the air quality is Satisfactory. It is clear that AQI is showing an increasing trend with the onset of winter and has started decreasing as summer progresses. During this period, Delhi recorded the worst AQI in the month of January 2023. Out of 15 months, for 11-months AQI in Delhi was above 100 while Korba had AQI above 100 for 13 months. March 2023 Air quality has improved over the previous month figures for Delhi while it has deteriorated for Korba. Delhi witnessed incessant rains and high winds during most of the month of March 2023 which resulted in better air quality. The overall data for Korba shows that Korba Air is more polluted than Delhi for longer durations in the year. March 2023 AQI is higher in both Korba and Delhi as compared to March 2022 which shows that the steps for air quality control are not being effective and more work needs to be done. The different colour bands in the graph respond to the AQI categories as stated in the NAAQs (More later in the document)

The above table shows the Monthly Average Heat Index for different cities.

Particulate Matter – Particulate matter or PM is the amount of dust particles in the air. These particles can be of different types i.e. organic, metallic etc. There are different sizes for these particles. Particles of size 10 micron are called PM 10. Those between size of 2.5 and 10 micron are called PM 2.5. those between 1 and 2.5 micron are labelled as PM1. The smaller the size of the particles, the easier for it to enter the air stream of the body and cause more impact. NAAQS and WHO (Word Health Organisation) have both set limits for amount of such particles in the air for PM 2.5 and PM 10. Below are the limits set. It is clear that the Indian standard is higher than the WHO ADQ standard. There are no standards yet for PM 1 which is considerably more harmful.

	PM 2.5 (ug/m3)	PM 10 (ug/m3)
NAAQS (Annual target)	40	60
WHO Interim target 1	35	70
WHO ADQ Target	5	15

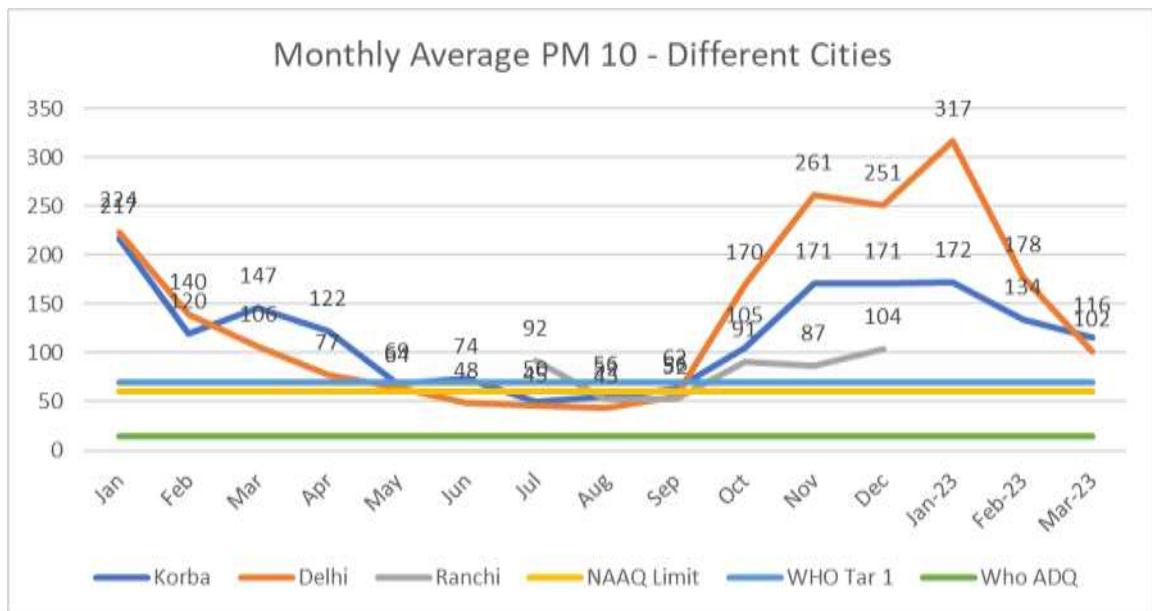

Below is the table and graph showing Monthly Average PM 2.5 values in different cities. In none of the months did any of the cities meet the higher Indian standard. In both Delhi and Korba, the values were more than 4 times the values in some of the months. Only during the monsoon period were the values closer to the standard but were still above. In Delhi and Korba both, the PM 2.5 particles have decreased in comparison to February 2023

The Table below shows the AQI Categories for All device's location wise since January 2022. The numbers are daily figures for individual devices which have been added up based on cities. It means that AQI in Korba was between 0-50 on 168 daily intervals as recorded by all devices installed in Korba. The data shows that in all locations more than 65% of the days, AQI has been above 100. Delhi and Korba recorded more than 38% of the intervals with AQI above 200.

The Table below show City wise and month wise AQI categories wise information. The numbers are daily figures for individual devices which have been added up based on locations for each month. It means that AQI in Korba was between 50-100 on 12 daily intervals in January 2022 as recorded by all devices installed in Korba. The data shows the severe AQI months for both Korba and Delhi. Atmospheric conditions play a vital role in Air Pollution hence, AQI is Satisfactory in the summer and monsoon month when dispersion of pollutants is high. Weather conditions along with emission sources should be carefully considered and emissions controlled to ensure AQI remains below 100 throughout the year. In Delhi, during March 2023, 88% of recorded AQI intervals were above 100 while the figure is 91% for Korba. In fact, in Delhi, AQI was above 200 for 43% of the recorded intervals. The corresponding figure in March 22 for Delhi was 44%.

Delhi	89	102	198	1100
Ranchi	-	-	-	-

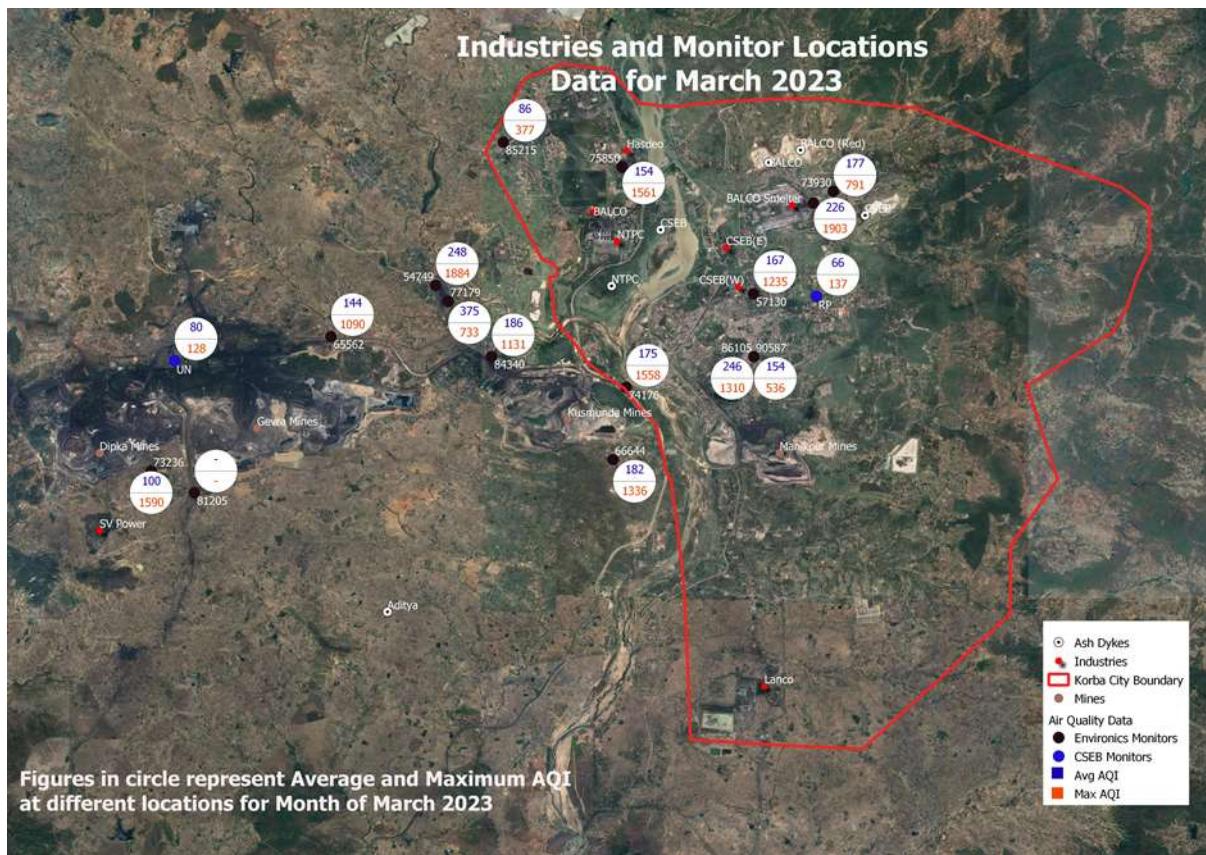

Table above shows the city wise Average PM 2.5, PM 10, AQI and Max AQI for March 2023. During this period Average AQI is highest in Korba and the Max AQI is recorded highest also in Korba and has been recorded just below 2000. Although such high numbers have been recorded only for a few intervals but getting such high number for AQI is a matter of grave concern. In Delhi also, the Max AQI recorded has exceeded 1000 which is a matter of concern and immediate action.

Data for individual devices placed at Korba can be seen in below table. Out of 15 devices which worked in Korba in this period 11 devices recorded maximum AQI greater than 1000. Average Monthly AQI is above 100 at all locations except 1. Device placed at Surakachar chowk near the underground Mines recorded the highest Average AQI at 375. 1 device have recorded Average AQI above 300 and another 4 above 200

The map image below shows the locations of the devices installed in Korba along with the locations of major coal mines, Thermal power plants and ash dykes. The Korba municipal boundary is marked in Red colour. The numbers in the map show the Average and Max AQI for each location along with the device number. Two monitors have been installed by CSEB at Ram Pur and Urja Nagar. Average Monthly AQI for March 2023 recorded by these devices is as below. Devices placed by Environics have been consistently recording higher AQI values. It may be because of placement of devices around Pollution sources which show such stark differences
